

Development of a mobile application for Fished

Development of a mobile application for Fished

This report summarizes a project done in collaboration with Oxidane Venture as the last part of a bachelor's degree in IT and Information Systems. The project spanned through the Spring semester of 2022, starting in early January and ending in late May. The project was offered by Oxidane Venture in regards to developing a mobile application for one of their investment companies, Fished. The main focus of the report is on the process, central decisions, and reflections.

As mobile application development was new to the majority of the group, it offered a steep learning curve. The curve flattened out as the project progressed and the group acquired more knowledge surrounding mobile application development. During the project, every member of the group participated in all aspects to some degree. This resulted in an even learning outcome, although some specializations occurred during the project mainly regarding development and report writing. The state of the mobile application reached a satisfactory level of functionality, however, there was still a long way to go before a release could be considered.
